

Hello there,

As a part of our interview process, we would like you to build an Android app for us. We need to have an Android mobile application which can help us searching for [Github](#) users.

As similar as possible, please make an app that looks like:

We can search for any query. Please use **endless scrolling** for the paging of the search results.

To do this, the app has to inquire the Github API. Please refer to the [documentation](#) on how to make requests. Make sure to handle the possible corner cases well (ex: this API has a limit of 10 hits per minute, empty result, etc).

To submit, please share your **code** & send us the **APK** file named *your_name_takehome.apk* which we can download, test, and inspect.

We Expect the result will have this 4 Points :

- No Bug and Crash
- All required Features are implemented and running well.
- Usage or utilization design pattern is a big plus
- Selection of library is a part of our grading

~Good Luck~
